

Return 2 Motion

Laser therapy (light amplification by stimulated emission of radiation) is the application of light energy to areas of the body to stimulate healing. It is an affordable, non-invasive treatment option that is used for both chronic (long standing) and acute (recent) pain. We use our new Class IV laser to provide the shortest, most powerful treatment currently available!

Every patient will be evaluated by one of our veterinarians to create an individual treatment plan based on each patient's specific need. Laser treatments are pain free and it does not require shaving of the hair over the treatment area or any kind of sedation.

Each session can take anywhere from 2 minutes up to 30 minutes of time. Acute issues are generally treated more frequently but over a shorter time frame, while chronic conditions tend to be treated less frequently but for a longer overall time frame. Depending on the condition being treated, it may only take a few treatments to see a difference. For chronic conditions, we recommend maintenance treatments for ongoing care.

Whether your pet is rehabilitating from trauma or injury, healing from wounds, or simply aging, your pet can benefit from this innovative approach to treating pain.

Benefits of laser therapy:

- Reduce inflammation
- Pain Relief (due to endorphin release)
- Improves circulation
- Enhances healing
- Reduces scar formation

Conditions we use laser therapy for:

- Muscle sprain or strain
- Orthopedic and neurologic conditions
- Post-operative incisions
- Skin conditions and ear infections
- Dental conditions
